

Experiment Name : Design and implementation of a local area network (LAN)
With a hub and six computers.

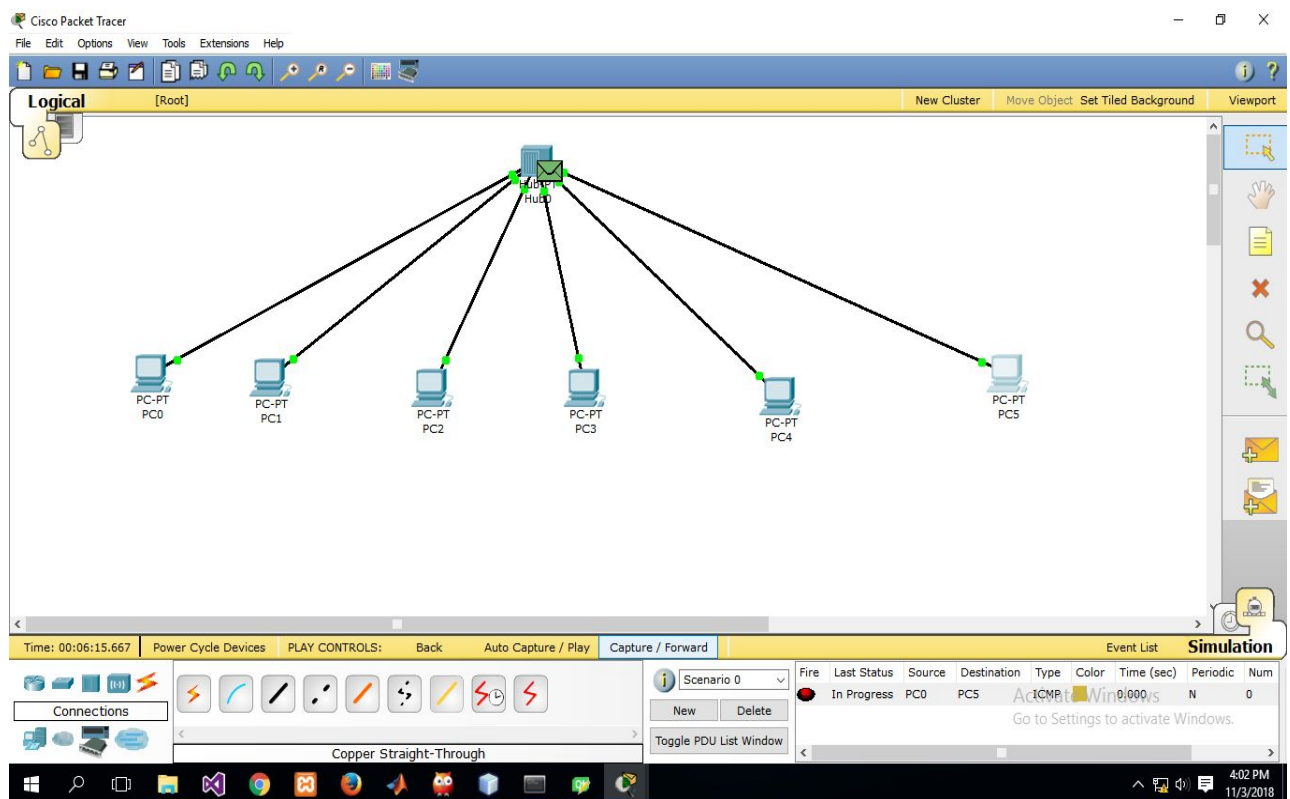

Experiment No : 02

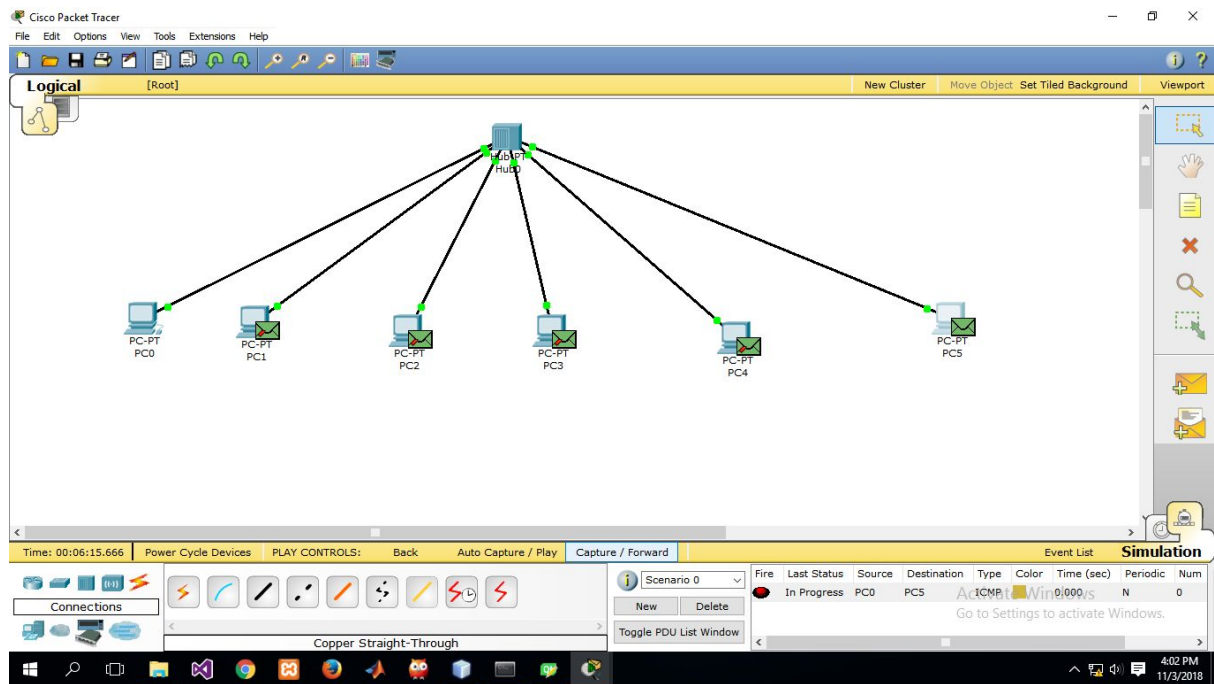

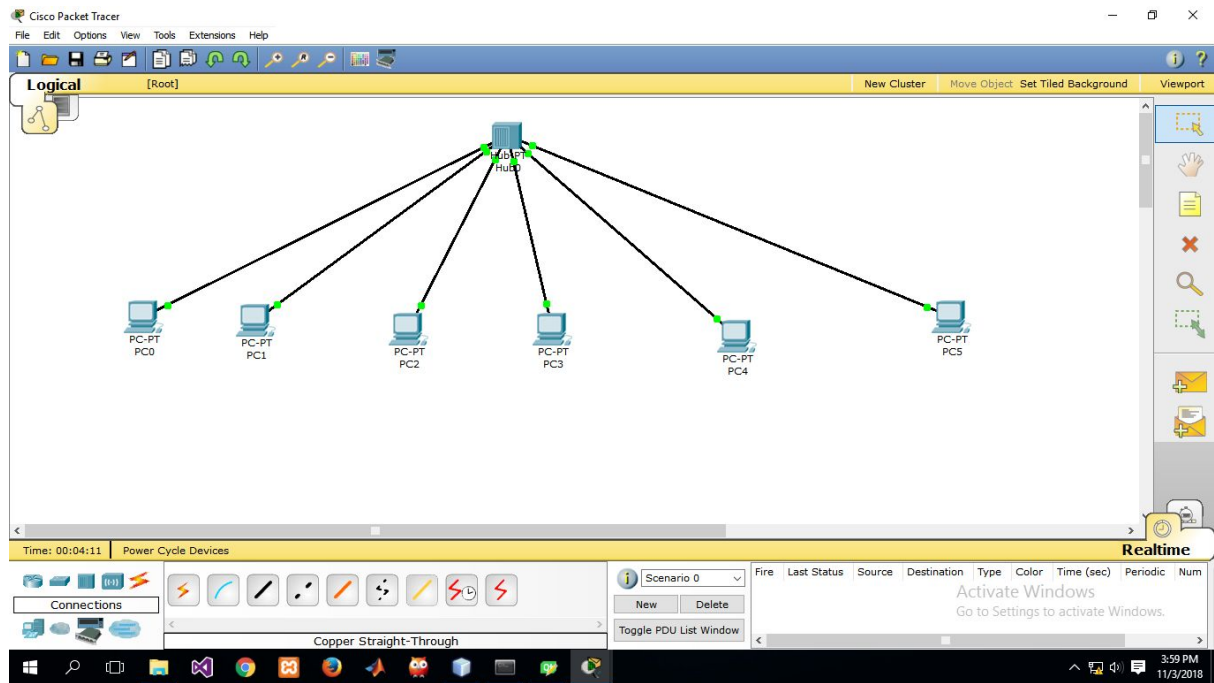

Introduction : Local area network is a small area network. We use this kind of network for personal uses. And all computers are connected to each other with wires.

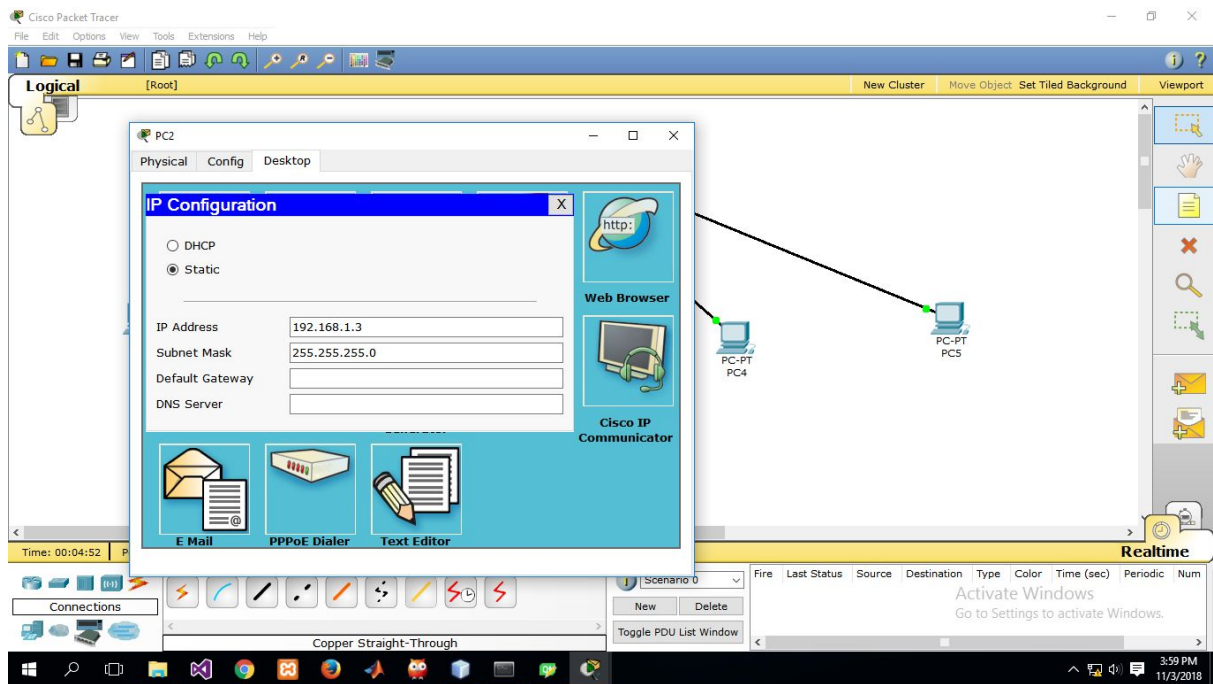

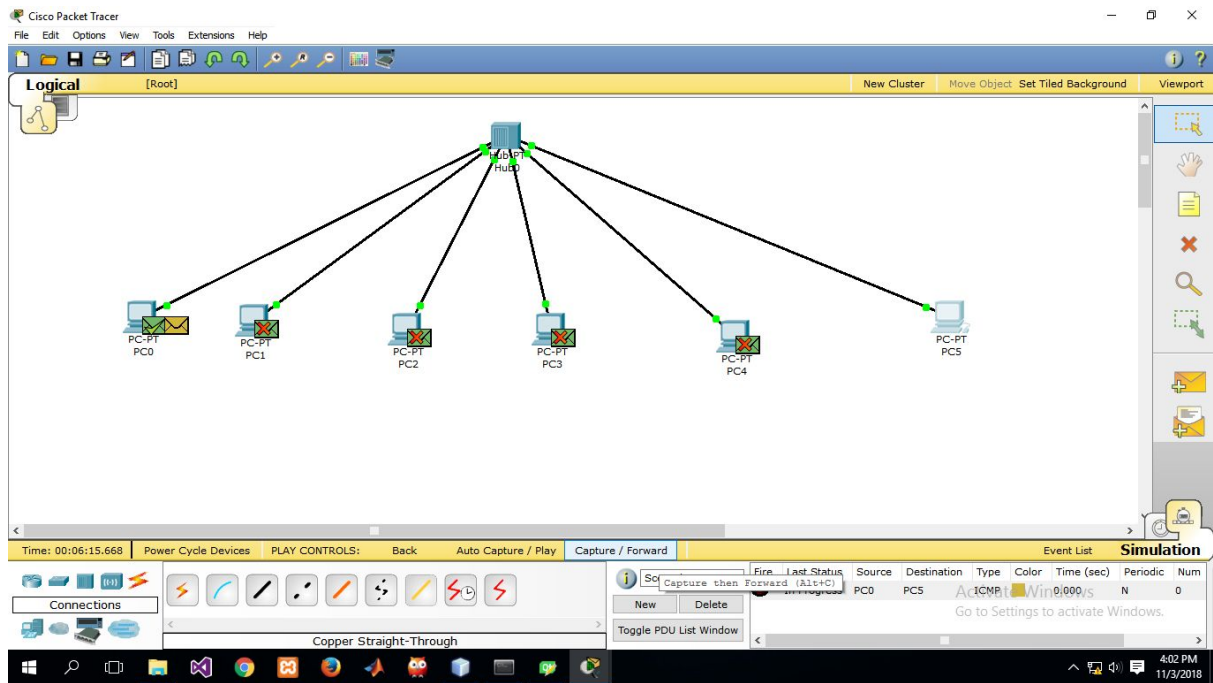

Objective :

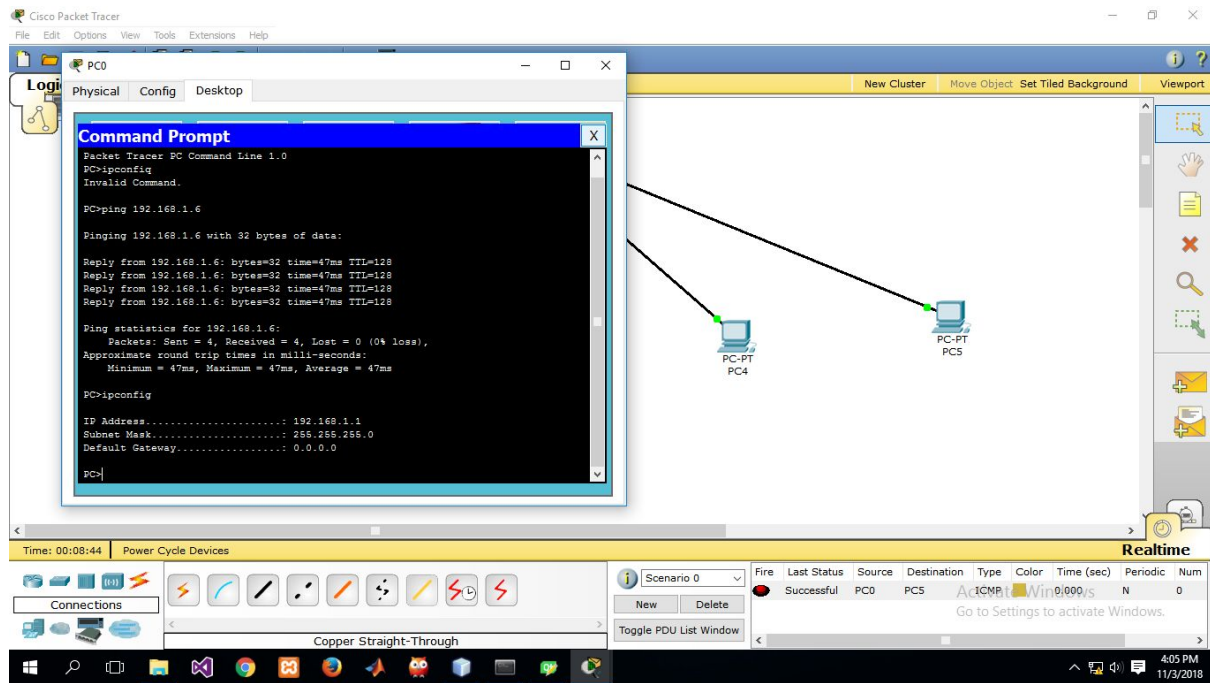

1. To create a local area network.
2. To send a message to its destination.
3. To receive a message.
4. To set IP address.
5. To find IP address of each computer.

Diagram :

Equipment : Switch , Hub , Wire , PC .

Command :

1. At first we need to take a hub, six computers and six wires.
2. Establish the connection between hub and computers.
3. Set IP address of each computer.
4. Send message from one to another computer.
5. Monitor all the work carefully.

Conclusion : A Local Area Network is simply a way of using computer hardware and software to further increase the productivity of personal computers and those who use them. So with this experiment we can make proper use of LAN and can create LAN for personal use.
